5.1.1. Stacked Plot

20:50

Create a stacked area plot to visualize the temperature variations for three different cities (City A, City B, and City C) across the months of the year. The temperature data is provided for each city in the editor.

Your task is to:

- Create a stacked area plot using the data.
- Label the x-axis as "Month", the y-axis as "Temperature", and provide the title "Temperature Variation" for the plot.
- Display the plot showing the temperature variation for each city throughout the

months of the year. import matplotlib.pyplot as plt import pandas as pd

Data for Months and Temperature for three cities

```
data = {  
    'Month': ['January', 'February', 'March', 'April', 'May', 'June', 'July', 'August',  
    'September', 'October', 'November', 'December'],  
    'City_A_Temperature': [5, 7, 10, 13, 17, 20, 22, 21, 18, 12, 8, 6],  
    'City_B_Temperature': [2, 3, 5, 6, 10, 14, 16, 17, 12, 9, 5, 3],  
    'City_C_Temperature': [3, 4, 6, 8, 9, 12, 15, 14, 10, 7, 4, 2]  
}
```

Write your code...

```
df = pd.DataFrame(data)  
plt.stackplot(df['Month'],df['City_A_Temperature'],df['City_B_Temperature'],df['City_C_T  
emperature']) plt.xlabel('Month') plt.ylabel('Temperature') plt.title('Temperature  
Variation') plt.show()
```

5.2.1. Titanic Dataset

16:35

Write a Python program to analyze and visualize data from the Titanic dataset based on the following instructions:

Dataset Information:

The dataset is stored in a CSV file named `titanic.csv` and has been loaded using the pandas library. It contains the following columns:

- Pclass: Passenger class (1 = First, 2 = Second, 3 = Third).
- Gender: Gender of the passenger (male/female).
- Age: Age of the passenger.
- Survived: Survival status (0 = Did not survive, 1 = Survived).
- Fare: Ticket fare paid by the passenger.

Visualization:

To represent these trends, you will create 5 visualizations using Matplotlib. The visualizations should be arranged in a 3x2 grid (3 rows and 2 columns).

Visualization Details:

Write the code to create a series of visualizations as follows:

Bar Plot (Pclass Distribution) :

- Create a bar plot to show the distribution of passengers across the different passenger classes (Pclass).
- Use the color skyblue for the bars.
- Title the plot as "Passenger Class Distribution" .
- Label the x-axis as "Pclass" and the y-axis as "Count".

Pie Chart (Gender Distribution) :

- Create a pie chart to display the distribution of male and female passengers.
- Use lightblue for males and lightcoral for females.
- Include percentages on the slices (use autopct='%1.1f%%').
- Title the plot as "Gender Distribution" .

Histogram (Age Distribution) :

- Create a histogram to visualize the distribution of passengers' ages.
- Use lightgreen for the bars with black edges (edgecolor = 'black').
- Set the number of bins to 8 for the histogram.
- Title the plot as "Age Distribution" .
- Label the x-axis as "Age" and the y-axis as "Frequency" .

Bar Plot (Survival Count) :

- Create a bar plot to show the count of passengers who survived and those who did not, based on the Survived column.

- Use the colors lightblue for survivors (1) and lightcoral for non-survivors (0).
- Title the plot as "Survival Count" .
- Label the x-axis as "Survived (0 = No, 1 = Yes)" and the y-axis as "Count".

Scatter Plot (Fare vs Age) :

- Create a scatter plot to visualize the relationship between the Fare and Age of passengers.
- Use orange for the data points.
- Title the plot as "Fare vs Age" .
- Label the x-axis as "Age" and the y-axis as "Fare".

Note: Refer to the displayed plot in the sample test cases for better understanding.

axes[1,0].set_ylabel('Frequency') survival_counts=df['Survived'].value_counts()
axes[1,1].bar(survival_counts.index,survival_counts,color=['lightblue','lightcoral'])
axes[1,1].set_title('Survival Count') axes[1,1].set_xlabel('Survived (0 = No, 1 = Yes)')
axes[1,1].set_ylabel('Count') axes[2,0].scatter(df['Age'],df['Fare'],color='orange')
axes[2,0].set_title('Fare vs Age') axes[2,0].set_xlabel('Age')

axes[2,0].set_ylabel('Fare')
axes[2,1].plot()

Write a Python code to plot a stacked bar chart that shows the count of passengers who survived and did not survive, grouped by passenger class (Pclass), in the Titanic dataset. The chart should display the following specifications:

1. Group the data by the Pclass column and count the number of survivors (0 = Did not survive, 1 = Survived) for each class using `value_counts()`.
2. Use a stacked bar chart to display the survival counts.
3. Add the title "Survival by Pclass" to the chart.
4. Label the x-axis as 'Pclass' and the y-axis as 'Count'.

1. Use the Pclass column to group the data for the boxplot.
2. Set the title of the plot to "Fare by Pclass".
3. Remove the default subtitle with `plt.suptitle("")`.
4. Label the x-axis as 'Pclass' and the y-axis as 'Fare'.

The Titanic dataset contains columns as shown below,

Sample Data:
